What is Seasons

Discover the Four Amazing Seasons of the Year!

DEFINITION

Seasons are the four distinct periods of the year, each with unique weather and daylight. They are caused by the Earth's tilt and orbit around the Sun.

KEY CONCEPTS

Spring

Spring is when flowers bloom, and temperatures begin to warm up after winter.

Summer

Summer is the hottest season, marked by long days and plenty of sunshine.

Autumn

Autumn, or fall, is when leaves change color and temperatures start to cool down.

Winter

Winter is the coldest season, often bringing snow and shorter days.

Earth's Tilt

The Earth's tilt affects how sunlight hits different parts of the planet, creating seasons.

EXAMPLES

- In spring, you might see flowers blooming.
- Summer days are perfect for swimming and picnics.
- In autumn, leaves turn red and orange.

MEMORY TIPS

- ★ Remember 'Spring brings flowers' to recall what happens in spring.
- ★ Use 'Summer is hot' to remember the heat of summer.
- ★ Think 'Autumn leaves fall' to connect autumn with falling leaves.

COMMON MISTAKES

- ✗ Confusing autumn with spring due to similar weather.
- ✗ Thinking all places have the same seasons.
- ✗ Not recognizing that seasons change based on location.

QUICK RECAP

Seasons are the four parts of the year: spring, summer, autumn, and winter. They are caused by the Earth's tilt and orbit around the Sun, affecting weather and daylight.
